DEPARTMENT OF BE COMPUTER SCIENCE ENGINEERING

SLEEP DISORDER DIAGNOSIS USING MACHINE LEARNING

FINAL REVIEW

UNDER THE GUIDANCE OF

Mr.N.KARTHICKKUMAR(AP/CSE)

PROJECT MEMBERS:

SANJAY R (730422104102)

SANJAY KUMAR KP - (730422104103)

VISHAL KUMAR YADAV - (730422104123)

PROBLEM STATEMENT

Sleep disorders are not just about feeling tired. They can lead to:

- Heart Disease (high blood pressure, heart attack, stroke)
- Diabetes & Obesity
- Depression & Anxiety
- Memory Loss & Poor Focus
- Nearly 1 in 3 adults suffer from insomnia or sleep apnea.
- If ignored, sleep disorders can shorten lifespan and silently destroy quality of life.

ABSTRACT

This project applies machine learning algorithms to detect and classify sleep disorders using simple health and lifestyle data. Instead of requiring patients to undergo complex tests, we use features like age, sleep duration, daily activity, and health indicators.

By training models such as Gradient Boosting, Random Forest, and Neural Networks, the system achieves high accuracy. The solution shows that AI-based screening can be a reliable alternative for early diagnosis, saving both time and cost.

OBJECTIVES

- To predict sleep disorders (Insomnia, Sleep Apnea, or None) using machine learning.
- To reduce reliance on expensive medical tests like PSG.
- To create a fast, accurate, and user-friendly system for both doctors and patients.
- To improve early detection and treatment for better health outcomes.

SYSTEM FEATURES:

•Easy-to-use interface.

•Takes basic inputs like age, daily habits, sleep time.

- AI-powered prediction of:
- Normal Sleep
- Insomnia
- Sleep Apnea

•Visual feedback (graphs & scores).

•Low-cost & scalable for hospitals and individuals.

FUTURE SCOPE

- Real-time monitoring of sleep at home.
- Personalized recommendations for lifestyle improvements.
- Building a global sleep health database for better research.

ALGORITHM USED

=> Gradient Boosting is a machine learning algorithm that builds models in a sequential way.

- It combines many weak learners (small decision trees).
- Each new tree learns from the mistakes of the previous trees.
- The process continues until the overall model becomes very strong.

WHY GRADIENT?

- At every stage, it calculates the error (residuals).
- Then, it improves the prediction by moving in the direction that reduces this error.

KEY ADVANTAGES :-

High Accuracy → Better than Random Forest or a single Decision Tree.

Good for Classification → Can classify patients into Normal / Insomnia / Apnea.

Handles Complex Data → Works well with multiple health features.

Low Cost Alternative → No need for expensive medical tests.

HOW IT WORKS

- **Data Collection**: Sleep health & lifestyle dataset (age, BMI, blood pressure, sleep duration, daily steps, etc.).
- **Preprocessing**: Clean data, handle imbalance using SMOTEENN, encode categorical values.
- **Feature Selection**: Identify most important factors affecting sleep disorder.
- **Model Training**: Train ML algorithms (Gradient Boosting, Random Forest, ANN, etc.).
- **Prediction**: Classifies a person into one of three categories:
  - **0 → No Disorder**
  - **1 → Insomnia**
  - **2 → Sleep Apnea**
- **Output**: Gives prediction with accuracy and confidence level.

ADVANTAGE

1. Early Detection

ML models identify sleep disorders at an early stage, helping prevent long-term health complications.

2. High Accuracy

Advanced algorithms provide precise classification and reduce human error in diagnosis.

3. Cost-Effective

Eliminates the need for expensive sleep-lab tests and reduces clinical workload.

4. Faster Diagnosis

Models analyze data in seconds, offering quick and reliable predictions.

5. Continuous Monitoring

Can be integrated with wearables for real-time monitoring and alerts.

6. Handles Large Datasets

ML can process and interpret complex sleep patterns and multidimensional data efficiently.
